

Technical Skills

Languages	C#, Kotlin, Java, TypeScript, JavaScript
Libraries / Frameworks	Angular, React, Node, .NET, Web API, Entity Framework
Databases	MongoDB, DynamoDB, CosmosDB, SQL Server
Systems / Platforms	GCP, AWS, Azure, Kubernetes, Docker, Helm

Work Experience

Oct '22 - Sep '23	Software Engineer - Dojo Ltd. <i>Communications & Identity</i> - Collaborated with a small, agile team to develop and maintain a shared service platform, facilitating the creation of services for internal teams - Successfully implemented an event-driven architecture on Google Cloud Platform (GCP) using PubSub, enhancing the platform's scalability and responsiveness, using MongoDB and a Domain-Driven Design - Part of an initiative to redesign the core internal service, consolidating it into a centralised instance that served as the primary point of communication for all other services, eliminating the need for ephemeral environments - Implemented push notification integration by integrating a third-party engagement platform as an extension to the existing service - Participated in a new project that introduced an in-house Identity Provider (IdP) and Identity service, complementing the existing legacy service, which is slated for gradual retirement. Contributed to architectural decisions and project timelines - Contributed to the upgrade process of all services utilizing our service to adopt the latest version of our library and PubSub event model. This streamlined the phase-out of the legacy system, achieving a swift and efficient transition
Aug '22 - Nov '21	Software Engineer - HealthHero Ltd. <i>MedSol PWA / SAPI</i> - Migrated old monolithic front-end repository into a monorepo solution, and rewrote the various client implementations into individual PWAs written in React - Refactored a vast amount of the monorepo solution to follow SOLID principles and create reusable React components - Carried out a project to introduce an adequate test framework into a core API named SAPI which had little-to-no testing in place, resulting in a Unit Test coverage of above 80% and an Integration Test coverage of above 70% - Was part of a task-force introduced to fix various critical bugs in a client API wrapper. The work conducted during this time resulted in the client renewing their contract for another 2 years
Nov '21 - Jul '19	Junior Software Engineer - Argus Media Ltd. <i>Direct Workspaces</i> - Greenfield project to create a customisable user workspace, providing key price benchmark data. Written in Angular and .NET Core - Implemented the Noda Time API to overcome the various design limitations in the .NET Time API - Carried out a project to introduce a theming service to asynchronously load and cache selected custom themes for the user, resulting in clients opting to use non-default themes at a rate of 84% - Attending monthly security advocacy meetings to identify areas of vulnerability within the code base and infrastructure DevOps pipeline - Collaborated on a greenfield project using AWS API Gateway and serverless computing to implement company-built custom workspaces
Jun '19 - Jun '18	QA Engineer - ASOS PLC <i>Enki Fashionbot</i> - Implemented new features to improve the user experience on a Azure hosted C# Facebook Chatbot - Added stored procedure which is run on every deployment to clean up CosmosDB of any test-user entries - Introduced brand mapping functionality so end-users could specify specific brands within their searches, thus allowing users to see what they actually want to see - Attended twice-weekly code craftsmanship classes run by my Lead Developer in order to make the transfer over to Software Developer - Completely refactored existing test suite left behind by prior Senior QA to make it more robust and mapped according to the Testing Pyramid. Resulted in reduced deployment times of around 40% and a less "flaky" test suite

Projects

Automated MMORPG Scripts

As a passionate gamer, my curiosity led me to explore the creation and execution of automated scripts in online games. During my exploration, I came across an open platform where I had the opportunity to engage with a deobfuscated version of the game Runescape, and interact with an open-source API developed for it. You can find the plugins related to this exploration on my GitHub page here: [harvey-plugins](#)

AWS Stock Checker

Created a straightforward, functional AWS script designed to monitor the availability of a specific item on a designated website and automatically notify the user via email when the item becomes available. Developed this project in response to a friend's request for a custom notifier solution when faced with the absence of built-in notification options.

Artificial Neural Network for Intrusion Detection

Final year project to develop a Neural Network for aid in intrusion detection, using the NSL-KDD dataset. Trained the Network using a back-propagation method to detect intrusions by analysing packet attributes. Programmed and trained the network in MATLAB and resulted in an 87% detection rate. Paper available at [harveysingh.co.uk/NeuralNetwork.pdf](#), and files available on request

Android Application Development

A group project to develop an Android application. Elected as team leader by my fellow members; gaining leadership experience in a project environment. Produced a set of deadlines within the group to ensure prioritised tasks were completed within set targets. Carried out research using journals, articles, the Internet and IEEE to ensure that the application met the "golden-rules" of user-friendliness. Developed the application using Java; using MySQL to develop the back-end database

Java Finch Robot Application

A group project to control a Finch Robot, with heavy use of the Strategy Design Pattern to complete this task. Designed and implemented a test-plan; ensuring full functionality was met and checking for any errors before the project was. Conducted a demonstration of the robot followed by a code review to analyse my methodology, which was met with a lot of praise for my effective use of the command pattern. Source code available at <https://github.com/harveysingh1/Finch-Robot-Project>

HarveySingh.co.uk, my personal website

I am in the process of (re)building [harveysingh.co.uk](#), a website which will contain information about myself and my history. Currently the website is written in pure HTML, CSS, JavaScript, with the responsive layout being design using Bootstrap. I am going to be remaking the whole website using Angular, whilst also creating a blog within which I will hope to share any relevant industry knowledge I have (and will) gain over the coming years of my career

Education

2012-2017	Bachelor of Science in Computer Science Brunel University , London	Award: Second Upper Class (2:1)
-----------	---	--

About Me

- One of the biggest hobbies I have is modifying and repairing cars. I recently have purchased a classic E30 BMW with hopes to do an engine conversion followed by fitting a turbocharger and several other upgraded components
- Programming and learning new technologies has now become a big part of my life, and I try to keep myself up-to-date with the latest in tech by attending conferences, joining meetup groups, and going to training courses
- I consider myself quite a social person and enjoy group outings with my team; I frequently go to escape rooms and other group activities which I think is beneficial for a team to mesh together
- I am an avid gamer and find myself playing the latest Triple-A titles and even older games such as Classic World of Warcraft. I have found a new interest in automating the "grind" needed in some of these games, and have attempted to create scripts in order to automate these processes
- I have always wanted to play guitar and at the age of 29 I have decided to pick it up! My goal is to get to Grade 8
- I like to keep fit and help others reach their fitness goals. So far I have lost approximately 32kg and have no plans to stop yet! I have taught many friends and family about the best (and healthiest) ways to reach their goals, whether they are trying to gain mass or lose weight, with successful results
- My work at ASOS and Veritas introduced me to Artificial Intelligence (specifically Natural Language Processing) has piqued my interest in the advancing region of Machine Learning and AI in general. I hope to work with this area of technology in my future career
